

Q1: Add a maven dependency and its related repository URL.

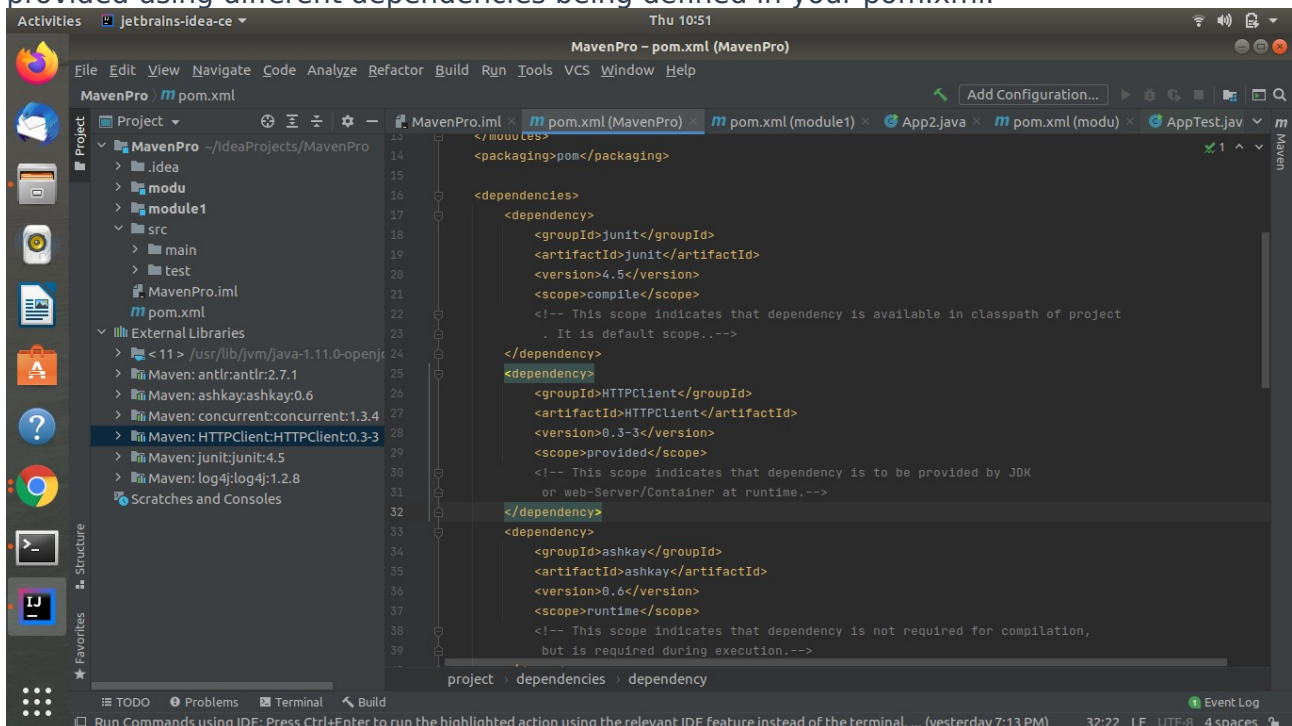

Q2: Add a new repository in the pom.xml and use its dependencies.

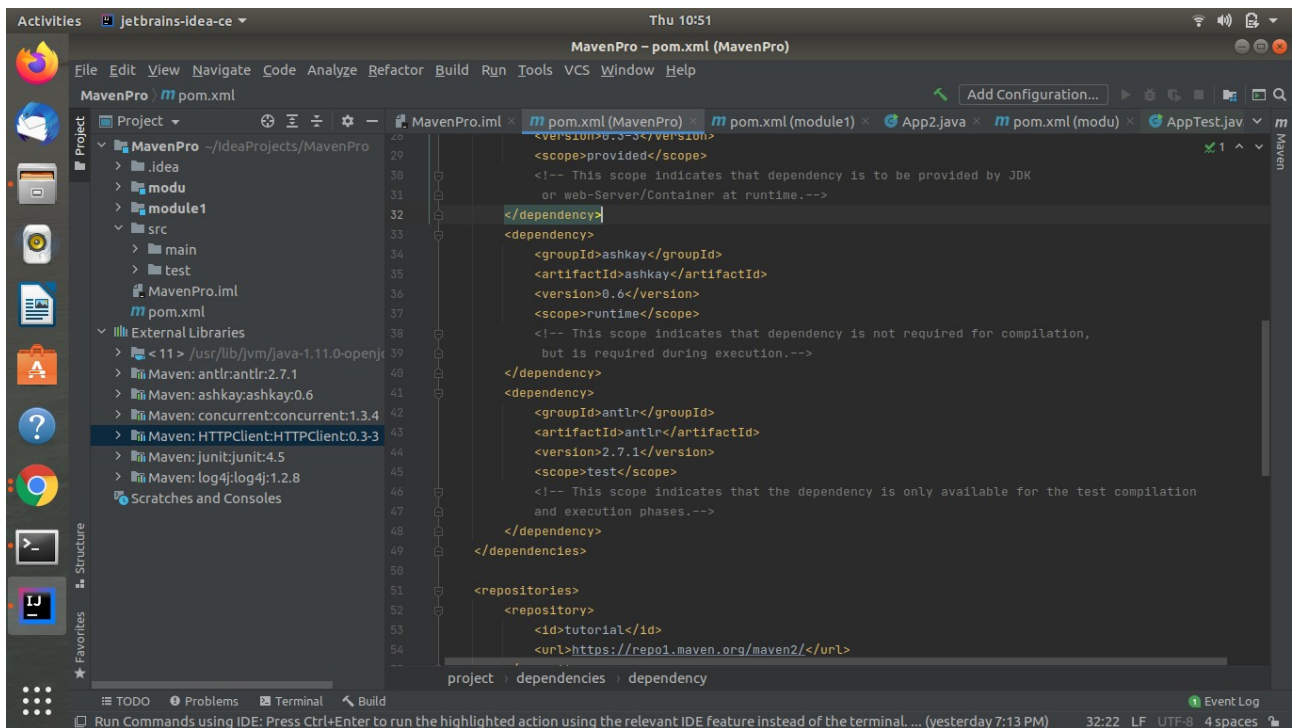

Q3: Using JAR plugin, make changes in the pom.xml to make the jar executable. Using java -jar JAR\_NAME, the output should be printed as "Hello World"

Q4: Differentiate between the different dependency scopes: compile, runtime, test, provided using different dependencies being defined in your pom.xml.

Q5: Create a multi-module project. Run package command at the top level to make jar of every module.
